

ECOCIVIX AI

04 — ECOCIVIX AI Design System

TEAM VELOCITY • HackYatra × EDM 3.0 • PRE-HACKATHON PLANNING

Purpose: Define the reusable visual language and UI primitives used across citizen, admin and community-intelligence experiences. Exact values are implementation baselines and may be tuned after the official challenge is known.

Status: PRE-HACKATHON DRAFT / PLANNING SPECIFICATION

Approval authority: Garv Nain

Design Direction

- Future civic intelligence; premium SaaS quality; environmental and civic cues without becoming a government portal.
- Use visual restraint: strong hierarchy, generous spacing, clear typography and controlled highlights.

Color Architecture

- Primary surface: white / very light neutral for clarity.
- Secondary surfaces: soft cool-gray neutrals.
- Primary accent family: cyan/blue-green for intelligence and environmental cues.
- Semantic colors: green for success, amber for caution, red for critical/error, neutral gray for inactive.
- Never communicate status using color alone.

Typography

- Use a modern highly legible sans-serif family.
- Clear hierarchy: display, H1, H2, H3, body, caption and metadata.
- Prefer readable line lengths and strong contrast.
- Numbers and metrics should be visually stable and easy to scan.

Spacing & Layout

- Use a consistent 4/8-point spacing rhythm.
- Prefer generous whitespace over dense card packing.
- Desktop: grid-based content with clear max-widths.
- Mobile: single-column priority-first layouts.

Core Components

- Navigation: navbar, sidebar, mobile navigation, breadcrumbs.
- Actions: buttons, icon buttons, CTAs, menus, dropdowns.
- Forms: input, textarea, select, checkbox, radio, file upload, location selector.
- Information: issue card, status badge, priority badge, metric card, AI insight card, timeline item.
- Data: table, list, chart container, map container, filter bar.
- Feedback: toast, modal, confirmation, loading, empty, error, success.

Buttons

- Primary: strongest action on a screen.
- Secondary: supporting action.
- Tertiary/text: low-emphasis actions.
- Destructive: clearly distinguish irreversible actions.
- States: default, hover, focus, pressed, disabled, loading, success/error where relevant.

Cards & Panels

- Cards should group related information, not simply decorate the page.
- Use consistent radius, border/elevation language and internal padding.

- Avoid nested card overload.

Status & Priority

- Status values: OPEN, ASSIGNED, IN_PROGRESS, RESOLVED, CLOSED, with REJECTED if approved.
- Priority values should be finalized in the AI/API contract.
- Always show textual labels in addition to color.

AI Visual Language

- AI assessment should have a consistent visual container and label.
- Clearly distinguish Citizen Input, AI Assessment and Administrative Decision.
- Do not make AI output look like an unquestionable system command.

Accessibility

- Keyboard focus, semantic controls, sufficient contrast, touch-friendly targets, labels and screen-reader-friendly structure.
- Provide reduced-motion behavior and non-color-only status indicators.

Component Acceptance

- Every reusable component should have defined states, responsive behavior, accessibility expectations and data requirements before broad reuse.

Design Tokens to Finalize

- Exact color hex values; typography family/weights; spacing scale; radii; shadows; borders; icon rules; breakpoints; motion tokens. These should be centralized rather than duplicated across pages.
