

ECOCIVIX AI

12 — Demo & Presentation Blueprint

TEAM VELOCITY • HackYatra × EDM 3.0 • PRE-HACKATHON PLANNING

Purpose: Define the final story and live demonstration so the judges understand the problem, product, AI value and real end-to-end workflow quickly.

Status: PRE-HACKATHON DRAFT / PLANNING SPECIFICATION

Approval authority: Garv Nain

Core Story

- Community problem → citizen signal → AI understanding → responsible action → citizen tracking → community intelligence.

Opening

- Start with a concrete real-world civic problem rather than a long technology introduction.
- Suggested framing: small community problems become bigger when they are difficult to understand, prioritize and route.

Problem

- Explain fragmented reporting, poor prioritization, unclear ownership and limited community-level visibility. Keep the problem specific and supported by the official challenge context.

Solution

- Introduce ECOCIVIX as an AI-powered community intelligence platform connecting Civic Intelligence, Eco Intelligence and Community Safety.

Live Demo — Golden Path

- 1. Citizen logs in. 2. Creates a realistic issue. 3. AI analyzes it. 4. Issue is persisted. 5. Admin sees it. 6. Admin reviews AI assessment. 7. Admin assigns/updates it. 8. Citizen sees the update. 9. Community intelligence reflects the real issue.

AI Moment

- Pause briefly on the structured assessment: category, priority, department, environmental relevance, safety relevance and suggested action.
- Explain that AI output is validated and treated as an assistive recommendation.

Technical Story

- React/Vite frontend → Express backend → Supabase/PostgreSQL/Auth/Storage → server-side AI → validated structured output → real database → dashboards/maps.

Impact Story

- Individual reports become structured community intelligence. Aggregated real data can reveal recurring civic, environmental and safety-relevant patterns.

3D/Wow Moment

- Use one memorable visual moment, preferably the transition from a citizen report into structured community intelligence. Do not let the visual distract from the actual product.

Presentation Structure

- Problem → Why current handling is difficult → ECOCIVIX solution → live demo → AI architecture → community intelligence → safety/trust → impact → closing.

Demo Rules

- No fake statistics; no fake final APIs; no hardcoded final issue state; no pretending AI worked if it failed.
- Use a rehearsed realistic dataset created through the real application.

Backup Plan

- Keep a known-good deployed build; keep screenshots/video of the golden path as an emergency fallback if network or provider failure occurs.
- Do not misrepresent a backup recording as a live interaction.

Closing

- Return to the core product loop: Report → Understand → Prioritize → Route → Act → Track → Learn.
- Close with the product vision rather than a list of technologies.

Presentation Acceptance Criteria

- Demo fits the available time; golden path works end-to-end; AI is visible; real persistence is demonstrated; admin/citizen loop is clear; safety boundaries are responsible; technical architecture can be explained in under a minute; team roles are clear.
