

ECOCIVIX AI — CONCEPT BRIEF

Pre-Hackathon Planning Document

1. Concept

ECOCIVIX AI is an AI-powered community intelligence platform that connects civic problems, environmental impact, and community safety in one platform.

2. Problem

Communities face civic, environmental, and safety issues that are often reported but poorly prioritized and coordinated.

3. Solution

ECOCIVIX uses AI to understand reported problems, assess relevant impact, identify priority and responsible action areas, and help citizens and administrators track resolution.

4. Three Pillars

Civic Intelligence: Understand and route infrastructure, sanitation, roads, streetlights, water/electricity and other civic problems.

Eco Intelligence: Identify waste, water wastage, pollution, cleanliness, energy wastage and environmental concerns.

Community Safety: Support safety incident reporting, safety-related civic reporting, emergency contacts/location sharing and identification of civic conditions that may create safety concerns.

5. Core Loop

Citizen observes → reports → AI understands → impact assessed → issue prioritized → routed → action taken → status tracked → community intelligence generated.

6. Key Differentiator

One problem can have multiple dimensions. A broken streetlight can be a civic issue and a safety concern at the same time. ECOCIVIX is designed to understand those connections.

7. Short Pitch

Communities struggle with civic, environmental, and safety issues that are often reported but poorly prioritized and coordinated.

ECOCIVIX AI uses AI to understand these problems, assess their impact, and turn them into actionable community solutions.

8. Product North Star

What is happening? How important is it? Who should act? What impact does it have? What should happen next?
